

## FEATURES

- ❑ Multi-standard 32-bit Audio Decoding plus Post processing
- ❑ Supports legacy audio formats and a wide array of post-processing
  - Dolby Digital® EX, Dolby Pro Logic® II, IIx, IIz 7.1, Dolby Headphone® 2, Dolby Virtual Speaker® 2, Dolby Volume® (original), Dolby Volume 258™ (lite), Audistry®
  - DTS-ES 96/24™ Discrete 7.1, DTS-ES™ Discrete 7.1, DTS-ES™ Matrix 6.1, DTS Neo:6®, DTS Neural Surround™ DTS Surround Sensation Speaker
  - MPEG-2 AAC™ LC 5.1
  - SRS® Circle Surround® II, SRS Circle Surround Auto, SRS Circle Surround Decoder Optimized, SRS TruVolume™ 7.1 (V 2.1.0.0), SRS TruSurround HD/HD4®, SRS WOW HD™, SRS CS Headphone™, SRS Circle Cinema 3D™, SRS Studio Sound HD™
  - THX® Ultra2™, THX Select2™
- ❑ Cirrus Logic's Applications Library
  - Cirrus Original Multi-Channel Surround 2 (COMS2), Cirrus Band Xpander™, Cirrus Virtualization Technology (CVT), Cirrus Intelligent Room Calibration 2 (IRC2), Cirrus Bass Enhancement (CBE)
  - Crossbar Mixer, Signal Generator
  - Advanced Post-Processors including: 7.1 Bass Manager Quadruple Crossover, Tone Control, 11-Band Parametric EQ, Delay, 2:1/4:1 Decimator, 1:2/1:4 Upsampler
- ❑ Up to 12 Channels of 32-bit Serial Audio Input

## Audio Decoder DSP Family with Dual 32-bit DSP Engine Technology

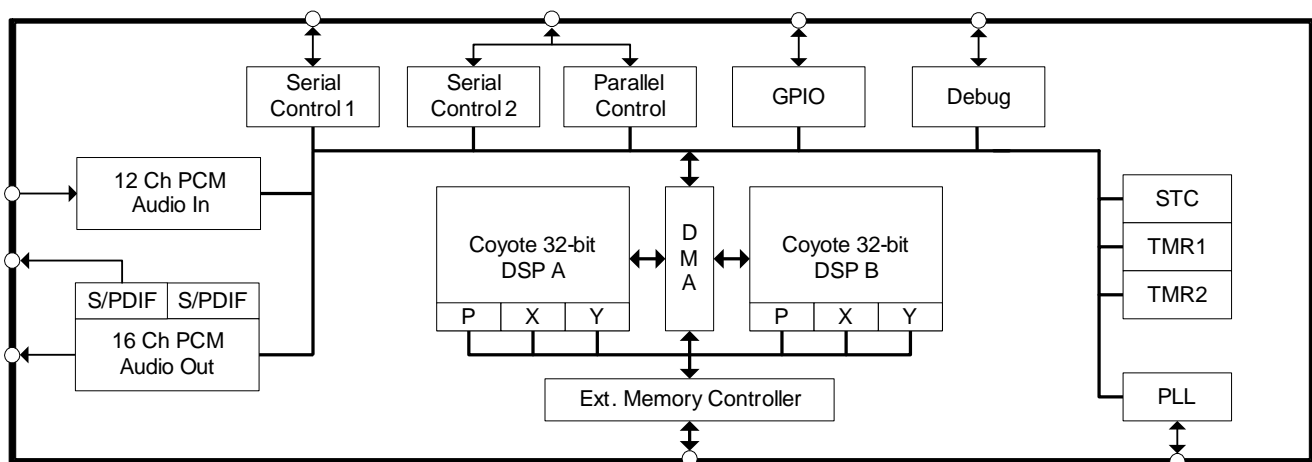

- ❑ 16 Ch x 32-bit PCM Out with Dual 192 kHz S/PDIF Tx
- ❑ Two SPI™/I<sup>2</sup>C™ Ports
- ❑ Customer Software Security Keys
- ❑ Large On-chip X, Y, and Program RAM & ROM
- ❑ SDRAM and Serial Flash Memory Support

The CS4953xx DSP family are the enhanced versions of the CS495xx DSP family with higher overall performance and lower system cost. The CS4953xx includes all mainstream audio processing codes in on-chip ROM. This saves external memory for code storage. In addition, the intensive decoding tasks of Dolby Digital Surround EX®, AAC multi-channel, DTS-ES 96/24, THX Ultra2 Cinema and Dolby Headphone can be accomplished without the expense of external SDRAM memory.

With larger internal memories than the CS495xx, the CS49531x is designed to support up to 150 ms per channel of lip-sync delay. With 150 MHz internal clock speed, the CS4953xx supports the most demanding post-processing requirements. It is also designed for easy upgrading. Customers currently using the CS495xx can upgrade to the CS4953xx with minor hardware and software changes.

## 1 Documentation Strategy

The CS4953xx data sheet describes the CS4953xx family of multichannel audio decoders. This document should be used in conjunction with the following documents when evaluating or designing a system around the CS4953xx family of processors.

**Table 1. CS4953xx Related Documentation**

Document Name	Description
<i>CS4953xx Data Sheet</i>	This document, which contains the hardware specifications for the CS4953xx family
<i>CS4953xx Hardware User's Manual</i>	Includes detailed system design information for CS4953x3 product family, including Typical Connection Diagrams, Boot-Procedures, Pin Descriptions, etc.
<i>CS495314/CS4970x4 System Designer's Guide</i>	A new consolidated documentation set for the CS4953x4 product family that includes: <ul style="list-style-type: none"> <li>Detailed system design information including typical connection diagrams, boot procedures, pin descriptions, etc. Also describes use of DSP Condenser™ tool</li> <li>Detailed firmware design information including signal processing flow diagrams and control API information</li> </ul>
<i>AN288 - CS4953xx/CS4970x4 Firmware User's Manual</i>	Includes detailed firmware design information including signal processing flow diagrams and control API information

The scope of the CS4953xx data sheet is primarily the hardware specifications of the CS4953xx family of devices. This includes hardware functionality, characteristic data, pinout, and packaging information.

The intended audience for the CS4953xx data sheet is the system PCB designer, MCU programmer, and the quality control engineer.

## 2 Overview

The CS4953xx DSP Family, together with Cirrus Logic's comprehensive library of audio processing algorithms enables the development of next-generation audio solutions. There are two classes of devices in the CS4953xx DSP family:

- CS4953x3 Class (ROM ID 3), comprising the CS495303 and the CS495313
- CS4953x4 Class (ROM ID 4), comprising the CS495304 and the CS495314

The primary difference between the CS4953x3 and the CS4953x4 classes is the support of the DSP Condenser application on the CS4953x4 class of products only. The DSP Condenser is a tool set that enables the DSP to automatically boot and configure itself from an external serial FLASH, thus reducing the traditional heavy loading on the part of the system microcontroller. Because of the design time savings, enhanced tools support, and better performance associated with the CS4953x4 product set, Cirrus Logic recommends that the CS4953x4 family be used for all new designs. More information on the DSP Condenser can be found in the *CS4953x4/CS497xx System Designer's Guide*.

Within each ROM ID class (3, 4), the breakdown into two devices per class (CS49530x and CS49531x) is based on the differences between the internal memory size and DSP firmware supported. Essentially, the audio processing features of the CS49531x are a superset of audio features available in the CS49530x. [Table 2, "Device and Firmware Selection Guide," on page 6](#) provides details of the differences between the two product classes.

**Note:** The CS495303/04/14 is available in a 128-pin LQFP package and the CS495313 is available in a 128-pin or 144-pin LQFP package.

## 2.1 Migrating from CS4953x3 to CS4953x4

- The recommended way to boot the DSP for normal operation is “master boot”. Refer to Chapter 1 of the *CS4953x4/CS4970x4 System Designer’s Guide*. CS4953x4 supports slave boot mode as well (used for programming the serial flash with the DSP code, through the SCP2 port).
- CS4953x4 DSPs are only available in 128 pin package.
- The serial flash chip select pin used is pin 14 (GPIO0) for master boot. Cirrus Logic recommends that at least an 8-Mb serial flash device be used. Refer to *CS4953x4/CS4970x4 System Designer’s Guide* for a list of flash types that are currently supported.
- CS4953x4 DSP family supports DSP Condenser and DSP Manager API for runtime control/host communication. Refer to *CS4953x4/CS4970x4 System Designer’s Guide* for details.

## 2.2 Licensing

Licenses are required for all third party audio decoding/processing algorithms, including the application notes. Contact your local Cirrus Sales representative for more information.

## 3 Code Overlays

The suite of software available for the CS4953xx family consists of an operating system (OS) and a library of overlays. The overlays have been divided into three main groups called Decoders, Matrix-processors, and Post-processors. All software components are defined below:

- **OS/Kernel** - Encompasses all non-audio processing tasks, including loading data from external memory, processing host messages, calling audio-processing subroutines, error concealment, etc.
- **Decoders** - Any Module that initially writes data into the audio I/O buffers, e.g. AC-3™, DTS, PCM, etc. All the decoding/processing algorithms listed below require delivery of PCM or IEC61937-packed, compressed data via I<sup>2</sup>S- or LJ-formatted digital audio to the CS4953xx.
- **Matrix-processors** - Any module that processes audio I/O buffer PCM data in-place before the Post-processors. Generally speaking, these modules alter the number of valid channels in the audio I/O buffer through processes like Virtualization ( $n \Rightarrow 2$  channels) or Matrix Decoding ( $2 \Rightarrow n$  channels). Examples are Dolby ProLogic II, IIx, IIz and DTS Neo:6.
- **Post-processors** - Any module that processes audio I/O buffer PCM data in-place after the Matrix-Processors. Examples are Bass Management, Audio Manager, Tone Control, EQ, Delay, Customer-specific Effects, Dolby Headphone 2 and Dolby Virtual Speaker 2, etc.

The overlay structure reduces the time required to reconfigure the DSP when a processing change is requested. Each overlay can be reloaded independently without disturbing the other overlays. For example, when a new decoder is selected, the OS, matrix-, and post-processors do not need to be reloaded — only the new decoder (the same is true for the other overlays).

[Table 2](#) below lists the firmware available based on device selection. Refer to AN288, *CS4953xx/CS497xxx Firmware User’s Manual* for the latest listing of application codes and Cirrus Framework™ modules available.

1. This feature list is a snapshot of features available as of the publication date of this revision of the data sheet. More features may now be available. Check with your Cirrus Logic Field Application Engineer (FAE) to obtain the latest feature list for the CS49530x and CS49531x products.

2. Additional processing (MPMA, MPMB, VPM, PPM) post any of the HD audio decoders may be limited. Contact your Cirrus Logic FAE for concurrency matrix.

## 4 Hardware Functional Description

### 4.1 Coyote 32-bit DSP Core

The CS4953xx is a dual-core DSP with separate X and Y data and P code memory spaces. Each core is a high-performance, 32-bit, user-programmable, fixed-point DSP that is capable of performing two multiply accumulate (MAC) operations per clock cycle. Each core has eight 72-bit accumulators, four X- and four Y-data registers, and 12 index registers.

Both DSP cores are coupled to a flexible DMA engine. The DMA engine can move data between peripherals such as the digital audio input (DAI) and digital audio output (DAO), external memory, or any DSP core memory, all without the intervention of the DSP. The DMA engine offloads data move instructions from the DSP core, leaving more MIPS available for signal processing instructions.

CS4953xx functionality is controlled by application codes that are stored in on-board ROM or downloaded to the CS4953xx from a host MCU or external FLASH/EEPROM. Users can choose to use standard audio decoder and post-processor modules which are available from Cirrus Logic.

The CS4953xx is suitable for audio decoder, audio post-processor, audio encoder, DVD audio/video player, and digital broadcast decoder applications.

#### 4.1.1 DSP Memory

Each DSP core has its own on-chip data and program RAM and ROM and does not require external memory for any of today's popular audio algorithms including Dolby Digital Surround EX, AAC Multichannel, DTS-ES 96/24, and THX Ultra2.

The memory maps for the DSPs are as follows. All memory sizes are composed of 32-bit words.

**Table 3. CS49530x DSP Memory Sizes**

Memory Type	DSP A	DSP B
X	16K SRAM, 16K ROM	10K SRAM, 8K ROM
Y	16K SRAM, 32K ROM	16K SRAM, 16K ROM
P	8K SRAM, 32K ROM	8K SRAM, 24K ROM

**Table 4. CS49531x DSP Memory Sizes**

Memory Type	DSP A	DSP B
X	16K SRAM, 16K ROM	10K SRAM, 8K ROM
Y	24K SRAM, 32K ROM	16K SRAM, 16K ROM
P	8K SRAM, 32K ROM	8K SRAM, 24K ROM

#### 4.1.2 DMA Controller

The powerful 12-channel DMA controller can move data between eight on-chip resources. Each resource has its own arbiter: X, Y, and P RAM/ROMs on DSP A; X, Y, and P RAM/ROMs on DSP B; external memory; and the peripheral bus. Modulo and linear addressing modes are supported, with flexible start address and increment controls. The service interval for each DMA channel as well as up to six interrupt events, is programmable.

## 4.2 On-chip DSP Peripherals

### 4.2.1 Digital Audio Input Port (DAI)

The 12-channel (6-line) DAI port supports a wide variety of data input formats. The port is capable of accepting PCM or IEC61937. Up to 32-bit word lengths are supported.

The port has two independent slave-only clock domains. Each data input can be independently assigned to a clock domain. The sample rate of the input clock domains can be determined automatically by the DSP, which off-loads the task of monitoring the S/PDIF receiver from the host. A time-stamping feature allows the input data to be sample-rate converted via software.

### 4.2.2 Digital Audio Output Port (DAO)

**Note:** There are two DAO ports. Each port can output eight channels of up to 32-bit PCM data. The port supports data rates from 32 kHz to 192 kHz. Each port can be configured as an independent clock domain in slave mode, or the ratio of the two clocks can be set to even multiples of each other in master mode. The two ports can also be ganged together into a single clock domain. Each port has one serial audio pin that can be configured as a 192 kHz S/PDIF transmitter (data with embedded clock on a single line).

Note: Only one S/PDIF transmitter pin is available in the 128-pin package.

### 4.2.3 Serial Control Port 1 & 2 (I<sup>2</sup>C or SPI)

There are two on-chip serial control ports that are capable of operating as master or slave in either I<sup>2</sup>C or SPI modes. SCP1 defaults to slave operation. It is dedicated for external host-control and supports an external clock up to 50 MHz in SPI mode. It is present in both the 144- and 128-pin packages. This high clock speed enables very fast code download, control or data delivery. SCP2 defaults to master mode and is dedicated for booting from external serial Flash memory or for audio sub-system control. SCP2 does not include the SCP2\_BSY# pin in the 128-pin package.

### 4.2.4 Parallel Control Port

The CS4953xx parallel port supports both Motorola® and Intel® interfaces. It can be used for both control and data delivery. The parallel port pins are multiplexed with serial control port 2 and are available in the 144-pin package.

### 4.2.5 External Memory Interface

The external memory interface controller supports up to 128 Mb of SDRAM, using a 16-bit data bus.

### 4.2.6 General Purpose Input/Output (GPIO)

Many of the CS4953xx peripheral pins are multiplexed with GPIO. Each GPIO can be configured as an output, an input, or an input with interrupt. Each input-pin interrupt can be configured as rising edge, falling edge, active-low, or active-high.

### 4.2.7 Phase-Locked Loop (PLL)-based Clock Generator

The low-jitter PLL generates integer or fractional multiples of a reference frequency which are used to clock the DSP core and peripherals. Through a second PLL divider chain, a dependent clock domain can be output on the DAO port for driving audio converters. The CS4953xx defaults to running from the external reference frequency and can be switched to use the PLL output after overlays have been loaded and configured, either through master boot from an external serial FLASH or through host control. A built-in crystal oscillator circuit with a buffered output is provided. The buffered output frequency ratio is selectable between 1:1 (default) or 2:1.

## 4.3 DSP I/O Description

### 4.3.1 Multiplexed Pins

Many of the CS4953xx pins are multi-functional. For details on pin functionality, refer to the *CS4953xx Hardware User's Manual*.

### 4.3.2 Termination Requirements

Open-drain pins on the CS4953xx must be pulled high for proper operation. Refer to the *CS4953xx Hardware User's Manual* to identify which pins are open-drain and what value of pull-up resistor is required for proper operation.

Mode select pins on the CS4953xx are used to select the boot mode upon the rising edge of reset. A detailed explanation of termination requirements for each communication mode select pin can be found in the *CS4953xx Hardware User's Manual*.

### 4.3.3 Pads

The CS4953xx I/O operates from the 3.3 V supply and is 5 V tolerant.

## 4.4 Application Code Security

The external program code may be encrypted by the programmer to protect any intellectual property it may contain. A secret, customer-specific key is used to encrypt the program code that is to be stored external to the device.

## 5 Characteristics and Specifications

**Note:** All data sheet minimum and maximum timing parameters are guaranteed over the rated voltage and temperature. All data sheet typical parameters are measured under the following conditions:  $T = 25\text{ }^{\circ}\text{C}$ ,  $C_L = 20\text{ pF}$ ,  $V_{DD} = V_{DDA} = 1.8\text{ V}$ ,  $V_{DDIO} = 3.3\text{ V}$ ,  $G_{NDD} = G_{NDIO} = G_{NDA} = 0\text{ V}$ .

### 5.1 Absolute Maximum Ratings

## 5.8 Switching Characteristics — XTI

Parameter	Symbol	Min	Max	Unit
External Crystal operating frequency <sup>1</sup>	$F_{xtal}$	12.288	24.576	MHz
XTI period	$T_{clki}$	41	81.4	ns
XTI high time	$T_{clkih}$	16.4	/m	ns
XTI low time	$T_{clkil}$	16.4	—	ns
External Crystal Load Capacitance (parallel resonant) <sup>2</sup>	$C_L$	10	18	pF
External Crystal Equivalent Series Resistance	ESR	—	50	$\Omega$

- Part characterized with the following crystal frequency values: 12.288 and 24.576
- $C_L$  refers to the total load capacitance as specified by the crystal manufacturer. Crystals which require a  $C_L$  outside this range should be avoided. The crystal oscillator circuit design should follow the crystal manufacturer's recommendation for load capacitor selection.

CS49531x-DVZ	—	$F_{xtal}$	131	—
Internal DCLK period <sup>1</sup>	DCLKP	—	7.7	ns
CS49530x-CVZ	—	6.7	$1/F_{xtal}$	—
CS49531x-CQZ	—	6.7	$1/F_{xtal}$	—
CS49531x-CVZ	—	6.7	$1/F_{xtal}$	—
CS49530x-DVZ	—	7.63	$1/F_{xtal}$	—
CS49531x-DVZ	—	7.63	$1/F_{xtal}$	—

1. After initial power-on reset,  $F_{dclk} = F_{xtal}$ . After initial kick-start commands, the PLL is locked to max  $F_{dclk}$  and remains locked until the next power-on reset.

## 5.10 Switching Characteristics — Serial Control Port - SPI Slave Mode

Parameter	Symbol	Min	Typical	Max	Units
SCP_CLK frequency <sup>1,2</sup>	$f_{\text{spisck}}$	—	—	25	MHz
SCP_CS falling to SCP_CLK rising <sup>2</sup>	$t_{\text{spicss}}$	24	—	—	ns
SCP_CLK low time <sup>2</sup>	$t_{\text{spickl}}$	20	—	—	ns
SCP_CLK high time <sup>2</sup>	$t_{\text{spickh}}$	20	—	—	ns
Setup time SCP_MOSI input	$t_{\text{spidsu}}$	5	—	—	ns
Hold time SCP_MOSI input	$t_{\text{spidh}}$	5	—	—	ns
SCP_CLK low to SCP_MISO output valid <sup>2</sup>	$t_{\text{spidov}}$	—	—	11	ns
SCP_CLK falling to SCP_IRQ rising <sup>2</sup>	$t_{\text{spiirqh}}$	—	—	20	ns
SCP_CS rising to SCP_IRQ falling <sup>2</sup>	$t_{\text{spiirql}}$	0	—	—	ns
SCP_CLK low to SCP_CS rising <sup>2</sup>	$t_{\text{spicsh}}$	24	—	—	ns
SCP_CS rising to SCP_MISO output high-Z	$t_{\text{spicsdz}}$	—	20	—	ns
SCP_CLK rising to SCP_BSY falling <sup>2</sup>	$t_{\text{spicbsyl}}$	—	$3 \cdot \text{DCLKP} + 20$	—	ns

1. The specification  $f_{\text{spisck}}$  indicates the maximum speed of the hardware. The system designer should be aware that the actual maximum speed of the communication port may be limited by the firmware application. Flow control using the SCP\_BSY pin should be implemented to prevent overflow of the input data buffer. At boot the maximum speed is  $F_{\text{xtal}}/3$ .

2. When SCP1 is in SPI slave mode, very slow rise and fall times of the SCP\_CLK edges may make the edges of the SCP\_CLK more susceptible to noise, resulting in non-smooth edges. Any glitch at the threshold levels of the SCP port input signals could result in abnormal operation of the port.

In systems that have noise coupling onto SCP\_CLK, slow rise and fall times may cause host communication problems. Increasing rise time makes host communication more reliable.

1. Master mode timing specifications are characterized, not production tested.
2. Master mode is defined as the CS4953xx driving both DAO\_SCLK and DAO\_LRCLK. When MCLK is an input, it is divided to produce DAO\_SCLK, DAO\_LRCLK.
3. This timing parameter is defined from the non-active edge of DAO\_SCLK. The active edge of DAO\_SCLK is the point at which the data is valid.
4. Slave mode is defined as DAO\_SCLK, DAO\_LRCLK driven by an external source.

Note: In these diagrams, Falling edge is the inactive edge of DAO\_SCLK

## 10 Revision History

Revision	Date	Changes
A1	February, 2006	Advance release.
A2	June, 2006	Updated part numbers for ordering (Tables 5 & 6), Updated $V_{OH}$ and $V_{OL}$ specification to include the current load used for testing
A3	July, 2006	Updated part numbers for ordering (Tables 5 & 6). Updated text in sections 3 and 4. Updated parameter descriptions in sections 5.1 and 5.3. Updated Tspickl, Tspickh, and Tspidov timing. Corrected Figure SPI Master Timing to use EE_CS. Added footnote to XTI table. Removed SCLK/LRCLK relative timing from DAI port timing. Removed SCLK/LRCLK slave relative timing from DAO port timing.
A4	October, 2007	Updated the Tspidsu, Tspickl, and Tspickh timing parameters for master mode SPI. This applies to both SPI ports.
PP1	May, 2008	Updated product feature list in <a href="#">Table 2</a> . Updated <a href="#">Figure 19</a> and <a href="#">Figure 21</a> .
PP2	June, 2008	Added typical crystal frequency values in Table Footnote 1 and minimum and maximum values of $F_{xtal}$ in <a href="#">Section 5.8</a> . Redefined Master mode clock speed for SCP_CLK in <a href="#">Section 5.11</a> . Redefined DC leakage characterization data in <a href="#">Section 5.3</a> , correcting units of measurement. Modified Footnote 1 under <a href="#">Section 5.10</a> .
PP3	September, 2008	Removed references to External Parallel Flash / SRAM Interface.
PP4	June, 2009	Updated product number references in <a href="#">Section 5.9</a> , <a href="#">Section 6</a> , <a href="#">Section 7</a> , <a href="#">Table 2</a> , <a href="#">Table 3</a> , and <a href="#">Table 4</a> . For all Active Low pins, changed Active Low pin designation from “#” character after the pin name to a line over the pin name as in “EE_CS”. Removed Active Low designation from the BDI_REQ pin in the 128-pin pinout drawings in <a href="#">Figure 19</a> and <a href="#">Figure 20</a> , and in the 144-pin pinout drawings in <a href="#">Figure 21</a> and <a href="#">Figure 22</a> . Updated the pin names referred to in the timing diagrams in <a href="#">Figure 9</a> , <a href="#">Figure 10</a> , <a href="#">Figure 17</a> , and <a href="#">Figure 18</a> . Updated the parameters in <a href="#">Section 5.15</a> .
PP5	July, 2009	Updated <a href="#">Figure 19</a> , <a href="#">Figure 20</a> , <a href="#">Figure 21</a> . Removed CS495314-CQZ and CS495314-CQZR from <a href="#">Table 5</a> and <a href="#">Table 6</a> . Added recommendation that CS4953x4 family be used with new designs. Updated <a href="#">Section 2</a>
PP6	November, 2009	Removed references to UART port. Removed references to 11.2896, 18.432, and 27 MHz frequency clocks in Note 1 in <a href="#">Section 5.8</a> “Switching Characteristics — XTI” on <a href="#">page 12</a> and the minimum and maximum External Crystal Operating Frequency values in that same section. Updated <a href="#">Section 5.17</a> “Switching Characteristics — Digital Audio Output Port” on <a href="#">page 24</a> . In <a href="#">Figure 21</a> , “144-pin LQFP Pin-Out Drawing (CS495313)”, on <a href="#">page 32</a> , moved SCP2_SDA from Pin 106 to Pin 105, deleted duplicate EE_CS from Pin 25, and designated Pin 140 BDI_REQ as active low. Designated Pin 32, BDI_REQ as active low In <a href="#">Figure 19</a> , “128-pin LQFP Pin-Out Drawing (CS495303/CS495313)”, on <a href="#">page 30</a> and in <a href="#">Figure 20</a> , “128-pin LQFP Pin-Out Drawing (CS495304/CS495314)”, on <a href="#">page 31</a> . In <a href="#">Section 5.3</a> , the parameter, “Input leakage current (all digital pins with internal pull-up resistors enabled, and XTI)”, Max value changes from 50 $\mu$ A to 70 $\mu$ A. In <a href="#">Section 5.13</a> , the parameter SCP_CLK low to SCP_SDA out valid with symbol “tiicdov” maximum value changes from 18 ns to 36 ns.
PP7	June, 2010	Updated <a href="#">Table 5</a> to show status of various parts.

Revision	Date	Changes
PP8	April, 2011	Added Tj conditions to <a href="#">Section 5.2</a> . Changed 500 ma to 350 ma in <a href="#">Section 5.4</a> . Removed references to DSD. Updated legal statement. Updated features list. Added notes to <a href="#">Section 5.10</a> . Updated <a href="#">Section 5.16 “Switching Characteristics — Digital Audio Slave Input Port” on page 23</a> Updated <a href="#">Section 5.17 “Switching Characteristics — Digital Audio Output Port” on page 24</a> .
PP9	August, 2011	In section <a href="#">Section 5.9</a> , added Max value of DCLK frequency value in CS49530x-DVZ and CS49531x-DVZ to 130 MHz; added Min value of DCLK period in CS49530x-DVZ and CS49531x-DVZ to 7.7 ns. Added notes to <a href="#">Section 5.10</a> . Updated <a href="#">Figure 14</a> .
PP10	February, 2012	Updated trademark information throughout document and boilerplate. Updated max Fdclk value for DVZ parts to 131 MHz and min DCLK value for DVZ parts to 7.63 ns in <a href="#">Section 5.9</a> . Updated tspickl and tspickh minimum values in <a href="#">Section 5.11</a> . Added tdaisstlr and tdaislrts to <a href="#">Section 5.16</a> . Changed max spec of Tdaosdv in <a href="#">Section 5.17</a> . Updated Tsdh minimum value in <a href="#">Section 5.18</a> .
